Productions

OVERVIEW

I) Types of Paint

- a) Acrylic
- b) Enamels
- c) Artist Oils

II) Paint Methodology

- a) Acrylic
- b) Enamels
- c) Artist Oils

III) Techniques

- a) Dry Brush
- b) Blending
- c) Shading
- d) Washes

IV) Applications

- a) Flesh Tones
- b) Leather
- c) Eyes

IV) Color Guides

- a) Humbrol (Enamel)
- b) Tamiya (Acrylic)
- c) Winsor & Newton (Artist Oil)

IV) References

TYPES OF PAINT

Acrylic Paints (Beginner's Choice)

Advantages

- Water-Based clean-up, no expensive thinners (Tip: Best agent to thin acrylic paint is Future Floor Finish)
- Excellent variety of colors
- Extremely flat finish

Disadvantages

- Very quick drying, hard to blend

Enamel Paints

Advantages

- Slower drying, Easy to Blend
- Excellent variety of colors
- Excellent variety of metallic and Gloss finishes

Disadvantages

- Noxious Thinner required

Artist Oils

Advantages

- Slowest drying, Easiest to Blend
- Excellent Blending Properties Minimizes Number of Colors Required
- Translucent

Disadvantages

- Noxious Thinner required (Turpentine)
- Expensive
- Sealant required

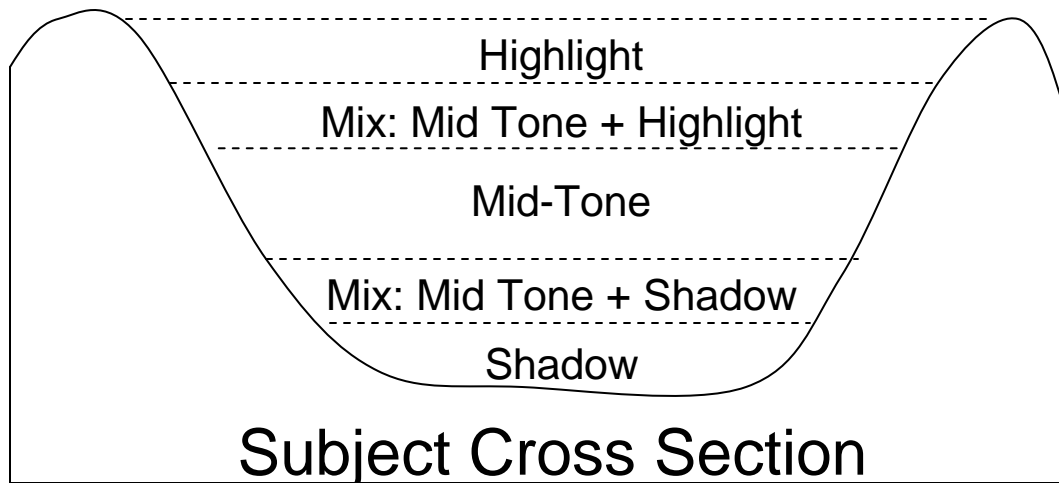

PAINT METHODOLOGY

Basics of Depth and Light:

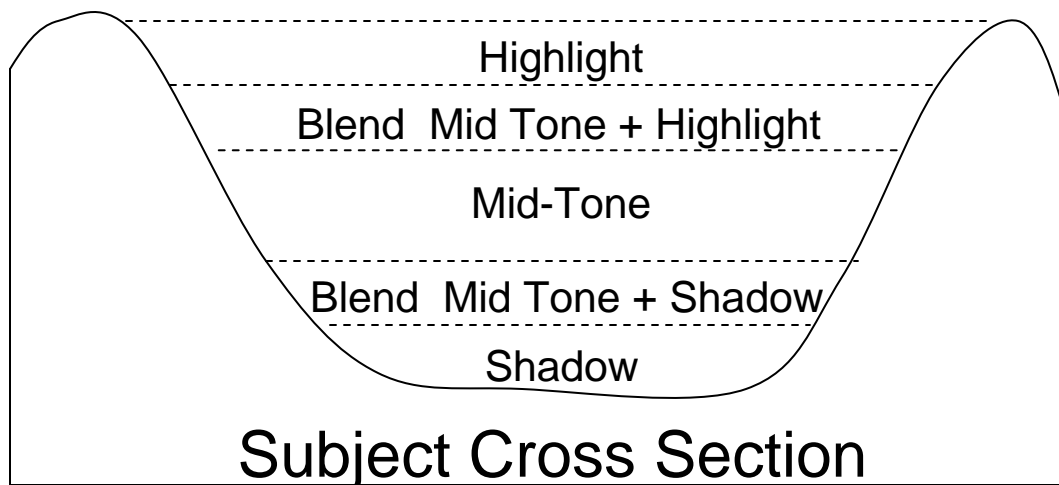

Acrylic Painting

Acrylics are hard to blend so a layering technique is required.

Enamel Painting

Enamels are easier to blend so pre-mixed Layers are not required.

Artist Oils

Oils are the easiest to blend and have the most Translucency. Paint a mid-tone base then add shadow and highlight.

TECHNIQUES

Drybrushing From Elliot Sanders' web site: <http://www.ellsweb.com>

Drybrushing is a highlighting technique which is excellent for raised details. Use a brush specifically for dry brushing wide, flat and soft.

Drybrushing is most effective when used with a color a shade or two lighter than the base.

Take your desired color and an old brush (as drybrushing wears brushes out) and dip it into the paint until the tip is saturated, then blot on a paper towel until no paint can be seen on a dark brush, or a light one looks pretty clean.

Take the brush and gently draw it along the raised parts you want highlighted. A little paint will stay on the highest edges and give great depth.

Note:

Dry brushing is NOT a good technique for large, wide, flat surfaces or areas with little detail. You should also be aware that it becomes chalky when too thick a paint is applied, or it can get messy by going over it too much when the paint beneath is still wet. Before applying the next lighter shade, be sure the paint on the figure is always dry.

There should be ALMOST NO paint on the brush, none whatsoever and it should take MANY coats to start to show detail. Too many people apply the technique too hard and with too much paint (although, in some cases can be the desired effect). Remember too that you can drybrush in various ways, don't always drybrush left->right, but do up and down and in circles and diagonals to ensure maximum coverage and detailing.

Blending

From Elliot Sanders' web site: <http://www.ellsweb.com>

Blending is used to highlight large, wide, flat surfaces and areas with little detail (Like a William's Bros. Pilot Figure). Blending is rather difficult and takes much practice. To blend one changes the tone of the paint as it crosses the surface of any non-detailed section.

Darker shades are laid into any depressions and carefully thinned and blended into the surrounding areas using a damp brush.

Note:

Highlighting should be accomplished in stages, lightening the shade a little with each level. Highlighting is VERY dependant on the translucency of the paint, ensure it is the consistency of between cream and milk and try to keep the coatings on the raised parts (rather than let it run into the recesses).

When blending paint, or layering if your using acrylics, you should aim for the smoothest transition between the darkest colour (either the basecoat if you follow the 'standard method', or if you prefer to paint both highlights and shadows from the basecoat, the darkest shadow colour) and the lightest. The example below is from a black undercoat, up through dark blue to a pleasant light whiteish blue final highlight.

Shading

From Elliot Sanders' web site: <http://www.ellsweb.com>

Shading is basically making the deepest creases and recesses of the miniature (folds in the cloth, hair, etc) darker than those parts that are elevated. It will give the illusion of depth, because the size of the miniature inhibits natural highlighting, so we get the perception that there is light shining upon the miniature and that makes it more realistic.

To shade, you either use pre-mixed inks or make your own by mixing black or brown (black on dark colors, brown on lighter colors such as yellow or red) with the base color. You're looking for a free-flowing but pigmented fluid that runs into the crevices of the figure and picks out details. If you mess up, wipe off excess and repaint the base area. The dilution ratio of 1 part paint to between 5 and 10 thinning solution is best, depending on the deepest shade required. For ink anywhere between 1 droplet of ink, to 1 water or thinning solution, up to a maximum mix of around 1 ink to 20 parts thinning solution is best.

Note:

Artists who work on large scale resin busts or figurines often apply the shading like a highlight - that is they paint smaller and smaller dark paint into the recesses until they have used the final shade color in the very deepest nooks.

Washes

Inks and paints can be applied thinly over base coats as washes. They sit in the recesses and form the shadows, though they often add a shine to the figure. Washes are translucent and thin and are applied over a base coat. Washes can help to reduce contrast between the highlights and shadows and are useful if you overdid some shading or contouring. You can incorporate washes into your shading too!

Typical wash is diluted
1 Part Paint: 10 Parts Thinner

Note:

Once applied, let the wash dry completely before moving on or it can "Wash" All the paint off your piece.

APPLICATIONS

Flesh Tones

Taken from my website: <http://www.acesofiron.com>

The following is a very basic process to give your figures a realistic appearance. The paint scheme uses an enamel base and artists oils to highlight and shadow. I use the same methods described below to paint all the Aces of Iron® figures on this site.

Philosophy- *Whether you are painting flesh, leather canvas or metal, the basic idea of figure painting is to paint a mid tone base, wash with a dark shadow tint, then add light highlights.*

The combination of enamels and artists oils allows a simple and effective method to achieve dramatic results with limited budget and time and requires surprisingly little artistic background. The translucence of the oils allows remarkable detail with simple layering and the long set time of the oils is very forgiving for first time painters.

Supplies:

Paints

- Small tin of good base enamel, *I prefer Humbrol Enamel Flesh (Matt# 61), but Tamiya Flat Flesh XF-15 Acrylic is also a good base.*
- Small tube of artist oil "Burnt Sienna"
- Small tube of artist oil "Cadmium Yellow"
- Small tube of artist oil "Flat or Flake White"
- Small tube of artist oil "Raw Umber"
- Small tube of artist oil "Cadmium Red"
- Testors "Dullcote" spray paint

Brushes

- Small detail brush- Sable Hair or soft bristle
- Medium detail brush- Sable Hair or soft bristle
- Medium Flat brush- Sable Hair or soft bristle

Miscellaneous

- Small palette (if you really want to feel like a painter) or something to squeeze paint onto such as small cardstock

Step 1 (Base Coat) - Paint the entire surface with a base coat. I prefer Humbrol Enamel Matt Flesh #61. Allow about 24 hours for the base to completely dry.

Step 2 (Shadow Base) - Paint the entire surface with "burnt sienna" artist oil. Apply the coat fairly thick and make sure you work paint into all the crevices. Clean your brush on the soft dry cloth, do not use turpentine, just keep wiping the brush on the cloth.

Step 3 (Shadow Tint) - Use the soft flat brush to gently remove the excess paint from the raised areas of the face. Wipe the brush on the soft dry cloth to remove the paint you remove from the raised areas of the face. Continue the process until you achieve a soft contrast between the shadows and the raised highlights.

Step 4 (Highlight Base) - Use the medium detail brush to apply a thin layer of "Cadmium Yellow" to the raised areas. Allow the paint to set for about an hour before proceeding.

Step 5 (Highlight Blend) - Use the clean soft dry detail brush to gently blend the yellow highlights. Blending is a process of removing the thick areas of the paint with the soft dry brush and blending the edges into the undercoat with a soft zig-zag motion.

Step 6 (Highlight 2) - Use the medium detail brush to apply a thin layer of "Flat or Flake White" to the same raised areas from step 4. Allow the paint to set for about an hour before proceeding.

Step 7 (Highlight 2 Blend) - Use the clean soft dry detail brush to gently blend the white highlights using the same blending process described in step 5.

Step 8 (Beard Shadow) - Use the small detail brush to apply a thin layer of "raw umber" to the areas of the face where beard grows. notice I only apply paint to about half the area leaving the highlight areas unpainted. The thickness of the layer will determine the amount of "growth" in the final face; Thin for less growth, thick for more growth.

Step 9 (Beard Blend) - Use the medium detail brush to blend the beard layer into the remaining portions of the face where beard grows, use the dry brush to remove most of the paint to leave just a subtle hint of beard.

Step 10 (Red Tint) - Use the small detail brush to apply a thin layer of "Cadmium Red" to the cheekbones of the face and the lower lip (no paint on the upper lip or he'll look like he's wearing lipstick).

Step 11 (Red Blend) - Use the medium detail brush to blend the red layer, use the dry brush to remove most of the paint to leave just a subtle tint of red.

Step 12 (Final White Highlight) - Use the small detail brush to add "flat or flake white" highlights to the detail areas shown. Wait one hour for the paint to "set" before proceeding to the blending step.

Step 13 (Blend White Highlight) - Use the small detail brush to gently blend the white highlights of the detail areas. This time don't remove as much of the white layer as in previous steps. This will add nice contrast in the final piece.

Step 14 (Final Dark Shadow) - Use the small detail brush to add "raw umber" to the detail areas shown (Edge of nose, Thin mouth line and mouth corners, just above chin and upper lip cleft).

Step 15 (Blend Dark Shadows) - Use the small detail brush to gently blend the dark shadows of the detail areas. This time don't remove as much of the dark layer as in previous steps. This will add nice contrast in the final piece.

Step 16 (Allow to Dry) - Let the piece set for 24-hours. Oils lighten over time and your piece will blend naturally over time.

Step 17 (Dullcote) - This is my "secret weapon". I spray the piece with dullcote to seal it and also to help to blend the layers. The dullcote is dry to the touch after about an hour and is completely dry after 24-hours.

Leather

Taken from my website: <http://www.acesofiron.com>

he following is a very basic process for painting Leather.

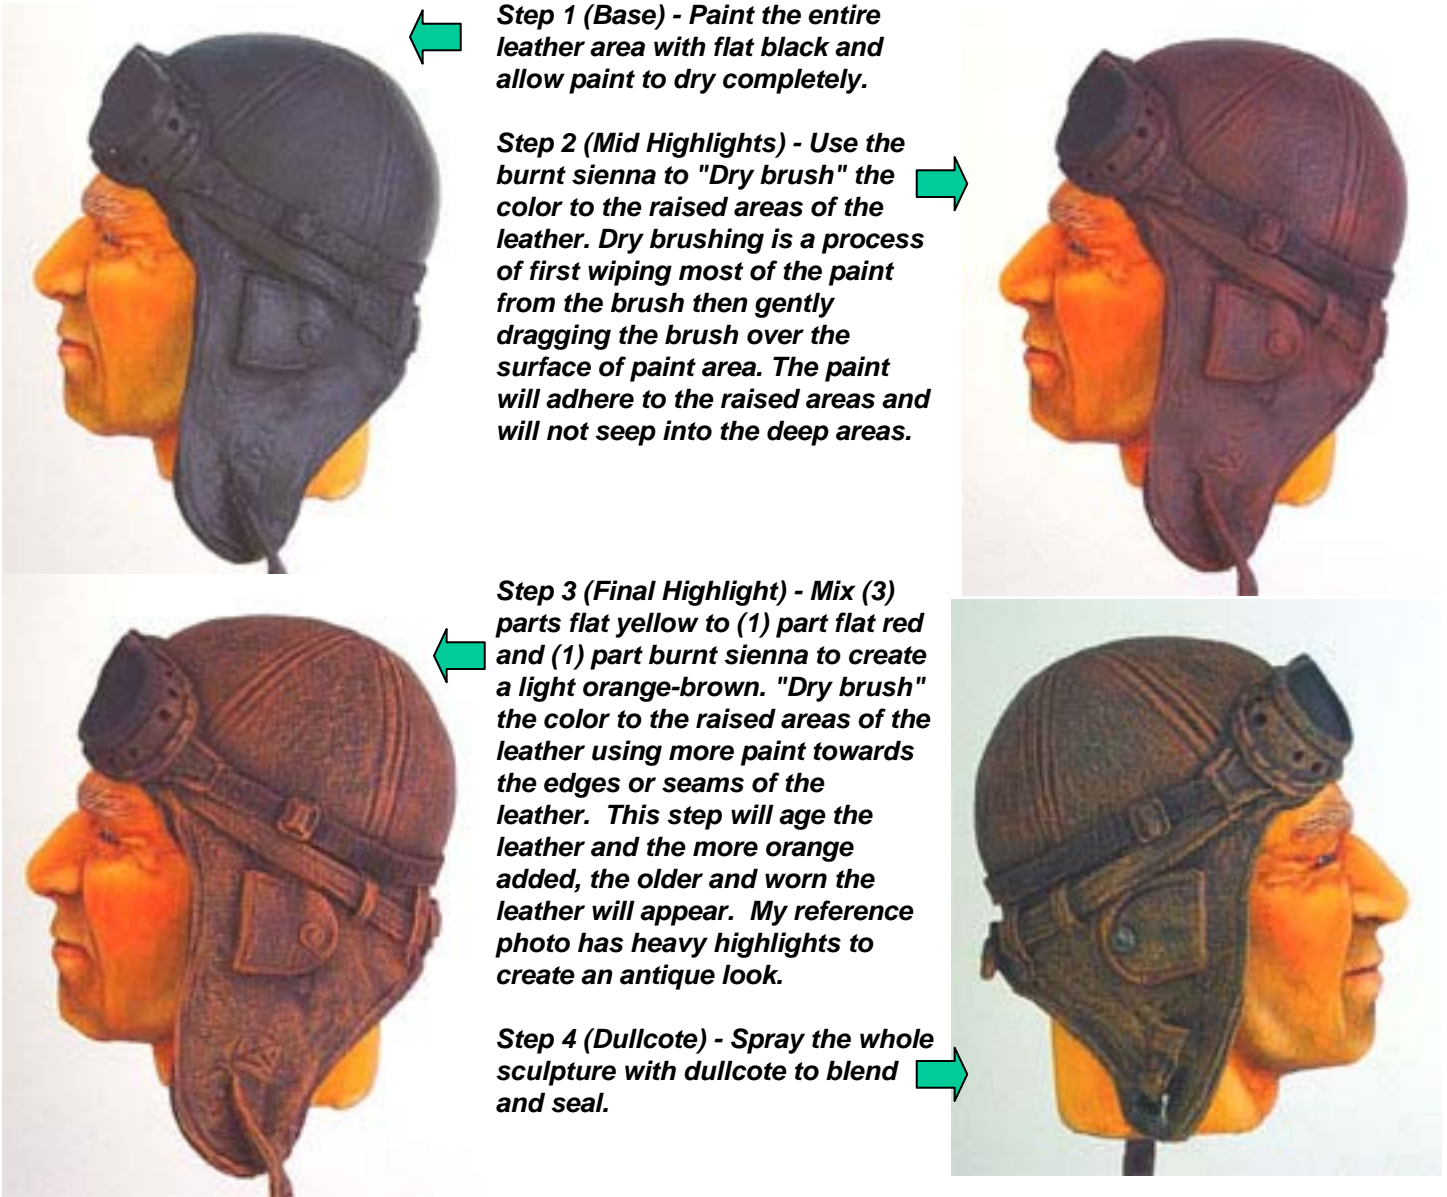

Supplies:

Enamel Paint Colors Used

- Flat Burnt Sierra, *Model Master 2007*
- Flat Black, *Model Master 1749*
- Flat Gelb (Yellow) RLM 04, *Model Master 2072*
- Flat Red, *Testors 1150*
- Testors "Dullcote" spray paint

Brushes/Miscellaneous

- Medium detail brush- Sable Hair or soft bristle
- Turpentine

Eyes

Taken from my website: <http://www.acesofiron.com>

The following is a very basic process for painting eyes.

Supplies:

Enamel Paint Colors Used

- Flat Burgundy or Maroon
- Flat Black
- Flat Light Gray
- Flat Light Blue, Light Green, or Light Brown (Depending on Preferred Eye Color)
- Flat White
- Testors "Dulcote" spray paint

Brushes/Miscellaneous

- Small detail brush- Sable Hair or soft bristle
- Fine point pen

Step 1 (Base) - Paint the entire eye area with a Burgundy base (Include the inside of the lower eyelids and tear ducts)

Step 2 (Dark Shadow) - Paint the inside of the upper eyelids with a flat black (This will add contrast and simulate the eyelashes).

Step 3 (Eyeball) - Paint each eyeball with light gray.

Step 4 (Mark the Pupils) - Use the fine point marker to mark the location of the pupil in each eye. Using a marker will reduce the chance the final figure ends up cross-eyed.

Text, graphics, and HTML code are protected by US and International Copyright Laws, and may not be copied, reprinted, published, translated, hosted, or otherwise distributed by any means without explicit permission from Aces of Iron Productions Inc. info@acesofiron.com

Step 5 (Define the Cornea) - Paint the entire cornea area using flat black.

Step 6 (Color the Cornea) - Use your preferred eye color to paint the cornea, leave a flat black edge around both sides of each cornea.

Step 7 (Add Pupils) - Paint the pupils using flat black.

Step 8 (Add Highlight) - Paint a small flat white dot on the right half of each pupil.

Step 9 (Dullcote) - Spray the figure with dullcote to seal the paint and blend the details. Some people add a spot of glosscote to the eyes, but I don't like the effect as reflecting light tends to wash-out all the details that were painted into the eyes.
